FEEDTHROUGH

## FLY CONTROL

# NEVER TASTED SO GOOD

**JustiFLY<sup>®</sup> 0.16% Diflubenzuron Milk Replacer Product** is designed to be mixed with whole milk and/or reconstituted milk replacer products to provide control of profit-robbing, disease-carrying flies. When mixed with whole milk or milk replacer products, diflubenzuron, the active ingredient in **JustiFLY<sup>®</sup> 0.16%** passes through the digestive tract and into the feces in sufficient concentration to kill fly larvae.

**JustiFLY<sup>®</sup> 0.16%** controls the infestation by inhibiting the development of horn fly, stable fly, housefly and face fly larvae in the manure and feces of treated calves, including veal calves.

## FLY CONTROL BENEFITS

- ▶ Biting flies, including stable flies and horn flies, increase animal stress and reduce time spent feeding, thus slowing animal weight gain and reducing milk yields.
- ▶ Depending on the number and types of flies and the type of facility and management practices, milk production losses from flies can range from negligible to up to 30%.
- ▶ Besides decreased feed efficiency due to fly biting activity, flies may also contribute to disease incidence in cattle, particularly mastitis in lactating cows and Pinkeye in young-stock.
- ▶ Non-stressed calves are healthier and more productive.
